

Welcome to InterFax 2.0

This sleek new update to our user interface elevates the user experience by incorporating a variety of new features.

Home page and widgets

The home page is the most noticeable new feature we've added to InterFAX. It is a fully customizable area where standard users and admins can choose and apply "Widgets" to create a custom dashboard that opens upon login.

Widgets are small tools varying in function that create easy access to key features of the broader set of everything contained in InterFAX, such as an inbox and outbox that shows the most recent fax messages sent in a side-by-side view.

Print to fax

Simplicity is key when it comes to sending messages. Users don't want to bounce back and forth between document applications, folders, or any other unnecessary screens.

That is why we have put together our print to fax integration which works with any application that supports print on Windows devices. Simply select File>Print or Ctrl P while you're in Microsoft Word, Adobe Acrobat, or any others, then select the "Print to Fax" Driver and your send fax screen will open with the attachment already added. All you need to do is add a recipient and off it goes!

Bulk downloads

Historically, InterFAX only offered the ability to download one fax at a time. With InterFAX 2.0, we have incorporated the ability to select

multiple messages and download them as a .ZIP file to enhance the end-user experience.

Single Sign-On (SSO)

This mechanism allows users to log in once and access multiple applications or systems without the need to authenticate each time. SSO support for InterFAX is being implemented through two popular protocols, "OpenID Connect" and "SAML." The choice between the two largely depends on specific requirements, existing infrastructure, and compatibility with the applications and services being used.

Barcodes

Using the new templates feature, you can now add metadata-encoded barcodes to your cover pages! These barcodes can be sent on individual messages or set up to be re-used in templates.

Cover pages and templates

InterFAX 2.0 includes one more exciting new feature: Cover Page Templates. Requested by many customers, this set of features allows users and admins to create templates for Cover Pages, save them, and apply them to users, groups, or the entire account.

Currently, there are two options for templates: a full-page, customizable document or a set header and footer with the ability for users to input text in the space in between using the native send fax "body." This feature also supports images, which means users can easily add their logo and standard company boilerplate to the header or footer of each document.

Ready to get things done?

Let us show you what Upland InterFAX can do.

[Request a Demo](#)

Upland InterFAX empowers users to cost-effectively fax at volume to anywhere in the world quickly, reliably, and securely from a web interface with no installations needed. With InterFAX, users can choose their pricing package and customize services to their needs using an integrated faxing developer API.
