

Speed Responses to Security Questionnaires

If your business responds to security questionnaires, you know the complexity of delivering accurate answers to hundreds of detailed questions... within a limited timeframe, while more questionnaires come pouring in. Make sure you're keeping up with demand.

Here's how you can deliver the facts faster:

Stop the Paper Chase

When you need information from people in different parts of the organization, it can be tough to get everything in one place. Create a library where everyone has access to the answers they need, whenever they need them.

Save Time for SMEs

Your subject matter experts don't want to answer the same questions over and over—so stop asking them to repeat themselves. Instead, empower them to review and update content when your organization changes security infrastructure or protocols.

Build a Better Process

Set yourself up to quickly find the best answer to each question. Speed review and approval by collaborating with the right people every time. Be confident you're using the most up-to-date, accurate information. Reduce the risk of errors and increase efficiency through automation.

5 TIPS for Improving your Security Questionnaire Process

1

Build a searchable library of approved responses to security questions.

2

Streamline collaboration by giving your team anytime, anywhere access to content.

3

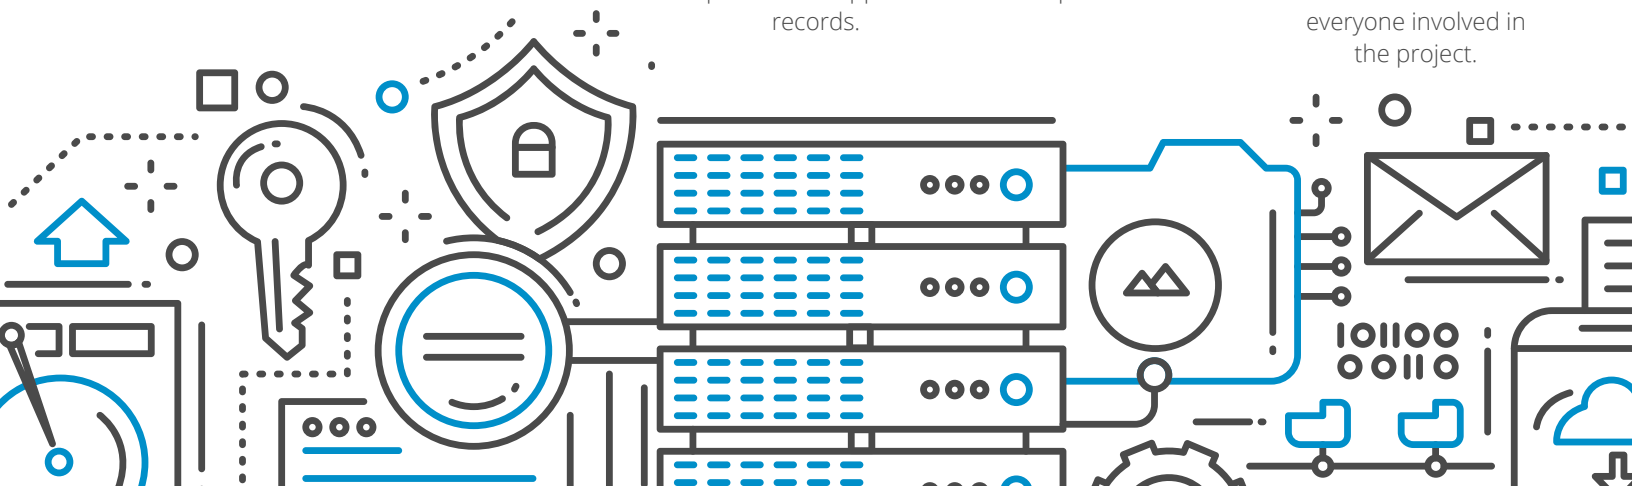

Assign and track content review and approvals from a single location; create audit trails of who has updated and approved records.

4

Automatically notify users when they have tasks due to ensure questionnaires are completed on time.

5

Manage projects more effectively with visibility into the progress of each questionnaire and the balance of work across everyone involved in the project.

Respond to security questionnaires faster and ensure you have the right answers every time.
